

AMENDMENTS TO THE CLAIMS

1 1. (Currently amended) ~~Apparatus~~ An apparatus for selectively shrinking a film
2 wrapped around a product (P), that comprises

3 - a frame (9),

4 - a driven conveyor (1), mounted on said frame (9), on which a plurality of products
5 (P) are sequentially transported,

6 - a heat source (5) disposed underneath the conveyor (1) and which generates a
7 hot fluid, and

8 - a plurality of nozzles (5.1) oriented towards the bottom of said conveyor (1), with
9 the hot fluid being conveyed to said nozzles (5.1),

10 ~~characterised in that~~ wherein the heat source (5) and the nozzles (5.1) are fixed,
11 and the apparatus also comprises closing means through which the hot fluid is allowed to
12 pass to the front and rear ends of each product (P) only.

1 2. (Currently amended) ~~Apparatus~~ The apparatus according to claim 1,
2 ~~characterised in that~~ wherein the closing means comprise moving means (5.2) on each of
3 the nozzles (5.1), said moving means (5.2) ~~pivoting~~, pivoting to enable or prevent the
4 passage of hot ~~fluid~~, fluid in relation to an axis (5.5) parallel to the plane of the conveyor
5 (1).

1 3. (Currently amended) ~~Apparatus~~ The apparatus according to claim 2,
2 ~~characterised in that~~ wherein the moving means (5.2) comprise a conduit (5.4) that is

aligned with the outlet conduit on each nozzle (5.1) to allow the passage of hot fluid.

4. (Currently amended) ~~Apparatus~~ The apparatus according to claim 3, characterised in that ~~it also comprises, wherein said apparatus further comprises~~ for each nozzle (5.1), an arm (5.3) connected to the moving means (5.2), said arm (5.3) moving the corresponding moving means (5.2) in relation to the axis (5.5).

5. (Currently amended) ~~Apparatus~~ The apparatus according to claim 1, characterised in that ~~wherein~~ the closing means comprise a plurality of shutters (10) disposed ~~transversally~~ transversely on the conveyor (1), and means (10.1) for selectively removing said shutters (10) from the conveyor (1) to allow the passage of hot fluid from the nozzles (5.1) to the front and rear transverse ends of each product (P).

6. (Currently amended) ~~Apparatus~~ The apparatus according to claim 1, characterised in that ~~wherein~~ the closing means comprise a plate (11) between the heat source (5) and the nozzles (5.1), the plate (11) being able to move ~~transversally~~ transversely in relation to the heat source (5) and the nozzles (5.1), and said plate (11) comprising at least one orifice (12), so that the passage of the hot fluid is enabled aligning the orifice (12) selectively with each nozzle (5.1).
